Connection with
gravity

Conclusions

The (4,0)-theory is extremely intriguing and interesting.

The (bosonic) field content involves “strange beasts” and is given by

$$(5, 1; 1) \oplus (3, 1; 27) \oplus (1, 1; 42)$$

(chiral tensor of mixed Young symmetry , chiral two-forms, scalars - 128 physical degrees of freedom).

Introduction

The (4,0)-theory is extremely intriguing and interesting.

The (bosonic) field content involves “strange beasts” and is given by

$$(5, 1; 1) \oplus (3, 1; 27) \oplus (1, 1; 42)$$

(chiral tensor of mixed Young symmetry , chiral two-forms, scalars - 128 physical degrees of freedom).

The theory is expected to have $E_{6,6}$ -symmetry (like maximal supergravity in 5 dimensions), the chiral 2-forms being in the 27 and the scalars parametrizing the coset $E_{6,6}/USp(8)$, which has dimension $78 - 36 = 42$.

Conclusions

The (4,0)-theory is extremely intriguing and interesting.

The (bosonic) field content involves “strange beasts” and is given by

$$(5, 1; 1) \oplus (3, 1; 27) \oplus (1, 1; 42)$$

(chiral tensor of mixed Young symmetry , chiral two-forms, scalars - 128 physical degrees of freedom).

The theory is expected to have $E_{6,6}$ -symmetry (like maximal supergravity in 5 dimensions), the chiral 2-forms being in the 27 and the scalars parametrizing the coset $E_{6,6}/USp(8)$, which has dimension $78 - 36 = 42$.

However, only the equations of motion of that theory are known, and only in the free case. Furthermore, there is no known Lagrangian, even in the absence of interactions.

Conclusions

A chiral 2-form in 6 dimensions is described covariantly by a two-form $A_{\mu\nu}$, the field strength $F = dA$ of which is self-dual, $F = *F$.

These equations imply the “Maxwell equations” $d*F = 0$.

They can be derived from a (first-order) quadratic Lagrangian, which has the unusual feature of not being manifestly covariant (MH -Teitelboim 1988).

The action reads $\int dx^0 d^5x (\mathcal{B}^{ij} \dot{A}_{ij} - \mathcal{B}^{ij} \mathcal{B}_{ij})$

where $\mathcal{B}^{ij} = (1/6)\epsilon^{ijmnp}F_{mnp}$ is the magnetic field.

(Quite generally, there seems to be a clash between manifest covariance and manifest duality.)

We will see that the equations of motion for a chiral (2,2)-tensor can also be derived from a similar variational principle.

Conclusions

A chiral 2-form in 6 dimensions is described covariantly by a two-form $A_{\mu\nu}$, the field strength $F = dA$ of which is self-dual, $F = *F$.

These equations imply the “Maxwell equations” $d*F = 0$.

They can be derived from a (first-order) quadratic Lagrangian, which has the unusual feature of not being manifestly covariant (MH -Teitelboim 1988).

The action reads $\int dx^0 d^5x (\mathcal{B}^{ij} \dot{A}_{ij} - \mathcal{B}^{ij} \mathcal{B}_{ij})$

where $\mathcal{B}^{ij} = (1/6)\epsilon^{ijmnp} F_{mnp}$ is the magnetic field.

(Quite generally, there seems to be a clash between manifest covariance and manifest duality.)

We will see that the equations of motion for a chiral (2,2)-tensor can also be derived from a similar variational principle.

There are, however, subtleties with respect to the 2-form case.

Conclusions

A general 2-form in six dimensions reduces to a 2-form and a vector in 5 dimensions.

$$\begin{array}{|c|} \hline \square \\ \hline \square \\ \hline \end{array} \rightarrow \begin{array}{|c|} \hline \square \\ \hline \square \\ \hline \end{array} \oplus \square.$$

In 5 dimensions, a 2-form is dual to a vector.

This gives thus two vectors.

However, the chirality condition in 6 dimensions

implies that the two vectors obtained in 5 dimensions are equal.

Conclusions

A general 2-form in six dimensions reduces to a 2-form and a vector in 5 dimensions.

$$\begin{array}{|c|} \hline \square \\ \hline \square \\ \hline \end{array} \rightarrow \begin{array}{|c|} \hline \square \\ \hline \square \\ \hline \end{array} \oplus \square.$$

In 5 dimensions, a 2-form is dual to a vector.

This gives thus two vectors.

However, the chirality condition in 6 dimensions

implies that the two vectors obtained in 5 dimensions are equal.

Thus, a chiral 2-form in six dimensions gives *a single* vector in 5 dimensions.

The Cotton tensor is a -tensor,
which contains three derivatives of the field Z_{ijmn} ,
and which is transverse and traceless,

$$\partial_i D^{ijrs} = 0 = D^{ijrs} \delta_{js}.$$

One can show that conversely, any -tensor which is
transverse and traceless
can be written as the Cotton tensor of some prepotential Z_{ijmn} .

Conformal geometry for a (2,2)-tensor

The Cotton tensor is a -tensor,
which contains three derivatives of the field Z_{ijmn} ,
and which is transverse and traceless,

$$\partial_i D^{ijrs} = 0 = D^{ijrs} \delta_{js}.$$

One can show that conversely, any -tensor which is
transverse and traceless
can be written as the Cotton tensor of some prepotential Z_{ijmn} .

In particular, the constraint on the electric field of the (2,2)-gauge field T implies that one can express T in terms of a prepotential Z so that $\mathcal{E}^{ijrs}[T[Z]] \equiv G^{ijrs}[T[Z]] = D^{ijrs}[Z]$. The relationship $T = T[Z] = "∂Z"$ can be easily written down.

gravity

Conclusions

One can also show that $\frac{1}{2}\epsilon^{mnik}\partial_k\mathcal{B}_{ij}{}^{rs} = \dot{D}^{mnrs}[Z]$

and therefore, in terms of the prepotential Z_{ijrs} , the self-duality condition reads

$$\frac{1}{2}\epsilon^{mnik}\partial_k D_{ij}{}^{rs}[Z] - \dot{D}^{mnrs}[Z] = 0.$$

The differential operator occurring in this equation is symmetric. Hence, this equation derives from the variational principle

$$S[Z] = \frac{1}{2} \int d^6x Z_{mnrs} \left(\dot{D}^{mnrs}[Z] - \frac{1}{2}\epsilon^{mnik}\partial_k D_{ij}{}^{rs}[Z] \right)$$
